In principle, greatest common divisors can be computed by determining the prime factorizations of the two numbers and comparing factors, as in the following example: to compute gcd(18, 84), we find the prime factorizations 18 = 2 · 3 · 2 and 84 = 2 · 2 · 3 · 7, and since the "overlap" of the two expressions is 2 · 3, gcd(18, 84) = 6. In practice, this method is only feasible for small numbers ...
