"Deadbeat Dams is a courageous book and much needed caveat published just when the dam builders are starting their latent cataclysmic assault on the rivers of the American West. As a former Commissioner of the Bureau of Reclamation appointed by President Clinton, Dan Beard's voice and leadership are needed more than ever to protect and restore rivers, and to end the dam builder schemes to engineer America's living rivers into concrete plumbing systems.

Because ozone and free oxygen atoms are highly unstable, they react very easily with nitrogen, hydrogen, chlorine and bromine compounds that are found naturally in Earth's atmosphere (released from both land and ocean sources).

As I recommend in Deadbeat Dams, the federal government should terminate its involvement with the Westlands Water District in California. "The insatiable greed of the 600 farm operators in Westlands is never-ending," I wrote. "No matter how much money and water we pour into their district, it won't be enough.

Maybe, then, we should pay attention to the truth part first. As Pamela Agawa, a curriculum coordinator for First Nation, M\u00e9tis and Inuit education (FNMI) at York Region District School Board in Ontario, told me, we need to figure out the truth for ourselves: "What biases do we carry; what learning do we need to do to better understand the true history of the country?"

Author Beard is the former Commissioner of the U.S. Bureau of Reclamation and knows the inside story of the waste of taxpayer money. The Bureau is responsible for building and operating water projects across the West, such as Hoover, Glen Canyon and Grand Coulee Dams.

In the scramble to claim water rights in the West during the fevered days of early emigration and expansion, running out of water was rarely a concern, and the dam building fever that transformed the West in the 19th and 20th centuries created a map of the region that may be unsustainable. Throughout the arid American West, metropolitan areas such as Los Angeles, Phoenix, Las Vegas and Denver need water. These cities are growing, but water supplies are dwindling. Scientists agree that the West is heating up and drying out, leading to future water shortages that will pose a challenge to existing laws. Dam Nation looks first to the past, to the stories of the California gold rush and the earliest attempts by men to shape the landscape and tame it, takes us to the "Great American Desert" and the settlement of the west under the theory that "rain follows the plow," and then takes on the ongoing legal and moral battles in the West. Author Stephen Grace, is a novelist, a storyteller, and the author of several non-fiction books on Colorado. He weaves the facts into a compelling narrative that informs, entertains, and tells an important story.

"The definitive work on the West's water crisis." --Newsweek The story of the American West is the story of a relentless quest for a precious resource: water. It is a tale of rivers diverted and dammed, of political corruption and intrigue, of billion-dollar battles over water rights, of ecological and economic disaster. In his landmark book, Cadillac Desert, Marc Reisner writes of the earliest settlers, lured by the promise of paradise, and of the ruthless tactics employed by Los Angeles politicians and business interests to ensure the city's growth. He documents the bitter rivalry between two government giants, the Bureau of Reclamation and the U.S. Army Corps of Engineers, in the competition to transform the West. Based on more than a decade of research, Cadillac Desert is a stunning expose and a dramatic, intriguing history of the creation of an Eden--an Eden that may only be a mirage. This edition includes a new postscript by Lawrie Mott, a former staff scientist at the Natural Resources Defense Council, that updates Western water issues over the last two decades, including the long-term impact of climate change and how the region can prepare for the future.

Focuses on the value of water in the west, with brief overview of the history of dams and wild life, the law and water allocation for both use and waste, and ways to modernize water management.

Focusing on the Snake River in Washington state, looks at the actions being taken to remove federally-funded hydroelectric dams from America's waterways and details the environmental, economic, and scientific benefits of dam removal and the powerful interests resisting this movement.

"Illuminating." --New York Times WIRED's Required Science Reading 2016 When we think of water in the West, we think of conflict and crisis. Yet despite decades of headlines warning of mega-droughts, the death of agriculture, and the collapse of cities, the Colorado River basin has thrived in the face of water scarcity. John Fleck shows how western communities, whether farmers and city-dwellers or U.S. environmentalists and Mexican water managers, actually have a promising record of conservation and cooperation. Rather than perpetuate the myth 'Whiskey's for drinkin', water's for fightin' over,' Fleck urges readers to embrace a new, more optimistic narrative--a future where the Colorado continues to flow.

Although advances in engineering can reduce the risk of dam and levee failure, some failures will still occur. Such events cause impacts on social and physical infrastructure that extend far beyond the flood zone. Broadening dam and levee safety programs to consider community- and regional-level priorities in decision making can help reduce the risk of, and increase community resilience to, potential dam and levee failures. Collaboration between dam and levee safety professionals at all levels, persons and property owners at direct risk, members of the wider economy, and the social and environmental networks in a community would allow all stakeholders to understand risks, shared needs, and opportunities, and make more informed decisions related to dam and levee infrastructure and community resilience. Dam and Levee Safety and Community Resilience: A Vision for Future Practice explains that fundamental shifts in safety culture will be necessary to integrate the concepts of resilience into dam and levee safety programs.
